CHUNK_ID: phone-housing-route
TITLE: Demo process: smartphone housing
ORIGIN: DEMO_FICTION
SOURCE: A4S authored scenario v1; not manufacturer process data

CONTENT
For this exhibition, A4S-DEMO-PART represents a smartphone housing. A carrier enters a stamping/pressing step, then the turning-over module reorients it 180 degrees for a fictional downstream inspection handoff. Order A is affected; upcoming order B can be placed on the explicitly simulated A4S-BACKUP. Existing seeded orders are ACCEPTED/planned, not evidence of running batches, accepted finished parts or real capacity.

CHUNK_ID: recovery-boundaries
TITLE: Recovery criteria and false conclusions to avoid
ORIGIN: PROJECT_CONTRACT
SOURCE: A4S MES action contracts / architecture tutorial

CONTENT
MES owns business rules, status and persistence. AAS holds semantic references, not copied order status. PLC interlocks stay authoritative for physical safety. Closing an issue does not repair a leak. Resolving a blocking issue recalculates order status and may return an accepted no-batch order to PENDING; read order_after rather than blindly resuming. A write timeout has unknown effects; read before retrying. The monitor stops when the operator ends the simulation; this does not prove real recovery.
